

**Key to the Genera of New World Dynastini (Scarabaeidae: Dynastinae)**  
Brett Ratcliffe 2001

1. Mandibles with 3 long teeth. Clypeal apex broadly bidentate (space between spiniform teeth almost as wide as eye). Males with 2 forward-projecting horns on pronotum, 1 at each anterior angle ..... *Megasoma*

1'. Mandibles entire, weakly bifurcate at apex, or with 2 distinct teeth. Clypeal apex narrowly bidentate or emarginate, never with spiniform teeth. Males with single, median pronotal horn or lacking horn ..... **2**

2 (1). Mandibles with 2 distinct, spiniform teeth. Elytra of males grey to greyish olive or brownish olive or yellowish olive with black spots. Pronotum in females with short, dense pubescence; elytra in females with longitudinal rows of long, dense pubescence ..... *Dynastes*

2'. Mandibles entire at apex or weakly notched. Elytra of males usually yellowish brown or else dark reddish brown or (rarely) black. Pronotum and elytra in females lacking dense pubescence ..... *Golofa*
